

Procountor's new features in version release 26.0

Summary

Improvement of the SIE file import.
Also other new features are released including attachment handling to bank statement and reference payment ledger receipts.

Details

SIE file import	
Improvement of the SIE file import	We have made an improvement to the importing of the SIE file. From now on, Procountor will import the missing bookkeeping accounts from the customer's SIE file to chart of accounts. (The importing concerns 4 digit accounts.) We have also improved the error messages given to be more informative.
Improvements to Graphical reports	
Management reporting and Management reporting by dimensions	<p>Past financial years are now displayed differently in <i>Management reporting</i> and <i>Management reporting by dimensions</i>.</p> <p>Open financial years and the latest closed financial year are displayed as before, but the data from financial years older than the latest closed financial year is aggregated on a monthly level in the <i>To details</i> tab. The events from each month have been grouped by account, dimension and receipt type.</p> <p>If a more detailed report from a past financial years is needed, the financial year in question needs to be reopened. The data will again be displayed on a daily level by the next work week.</p>
Date selection using calendar component	The date selections in graphical reports can now be entered using a calendar component. Alternatively, dates can be entered by text like before.

Other improvements	
Attachment handling to bank statement and reference payment ledger receipts	We have earlier implemented attachment handling already to purchase invoices and now have implemented the same kind of handling also to bank statements' and reference payments' accounting view.
Improved user account locking mechanism	<p>We have introduced a new user account locking mechanism. If a user enters a wrong user account or personal password six times when logging in, the user account will be locked for five minutes.</p> <p>After waiting for five minutes, it is then possible to try logging in again. If the user then enters a wrong user account or personal password again six times, the user account will be locked for twenty minutes before it is possible to try logging in again.</p> <p>After this when entering wrong user account or personal password again for six times, the user account will be locked until customer service will open it for the user.</p>
One-time password list	<p>When opening a one-time password list in Procountor, it will be automatically saved to your local computer, instead of opening the list on a new web browser tab or window.</p> <p>This change was made because most of the modern web browsers will automatically block websites to open pop-up tabs and windows, and this made it unclear to notice if the one-time password list was downloaded or not.</p> <p>Now downloading of the one-time password list should be clearly visible.</p>
Reminder to update personal information for all Procountor users	<p>Users are to be automatically reminded once in every 6 months to update their personal information. Purpose of the feature is to kindly remind users to make sure that their personal information is still valid.</p> <p>This will help customers and Procountor as a service provider to access up to date and correct information of users, for example in case of login problems.</p> <p>The reminder will be shown for users when logging into Procountor, after entering username and personal password.</p>
